

My Nearest Best Market App

Background: Often due to shortage of time we are not able to do a search on prices and commodities available in our neighborhood shops and market places. Also, to keep a track of the ever changing prices in these markets is a time consuming and difficult task. This usually leads to buying products at high prices even when they may be available at lower prices.

Data source: Datasets (www.data.gov.in):

1. Commodity-wise, Market-wise Daily Report

Users: Any individual

Description: The mobile application would consist of the following:

- Icons for each commodity
- The prices of all commodities and all markets where these commodities are available would be listed in the app
- The app would calculate/generate/search the best price available for a selected commodity.
- Next, the application would locate the nearest market place or shop where the commodity is available at this best price, with the help of a map.

Potential: This application would enable its users to purchase commodities at cheaper prices. The users may select the commodity of their choice and then find out the details regarding its current price in various markets. First, the user searches for the commodity of his/her choice and the lowest price at which it is available in the market in his/her city. Next, this application would help them locate the closest market place where the commodity is available at the best price (after identifying the location of the user). With the help of this app consumers may easily search the best price of their choice of commodities and the best markets where these commodities are available within seconds.
