State Crop Management System

An online portal for the Government wherein any crop which arives at the Grain Market,its details are to be recorded immediately and supplied to the central databse via online portal. Through this each state's government would be aware of how much crop is ultimately ariving in the market which will help them formulate how much is the overall production available to the consumer. This will help government make proper and timely policies for stock building, release of stocks in market to contain volatility, dissemination of information to farmers timely telling them what should they plant or grow and where they will get remunerative prices of the crop. In the same programme farmers can know weather forecast and weather information. This application can be accessed by farmers through their mobile phones and effort can be made to develop this application on the platform of lower range of mobile phones like the Nokia 1100(Symbian platform) or Samsung Guru series so that it is accessible to wide population of farmers. Through this farmers can also know the daily prices of crops in the market. Thereby they can take better decisions as to what should be grown by them to get more returns.
